

AHF2815T SERIES **28V Input, Triple Output**

HYBRID-HIGH RELIABILITY DC/DC CONVERTER

Description

The AHF2815T Series of DC/DC converters provide 8W of power and an extended temperature range for use in military and industrial applications. Designed to the nominal input requirements of MIL-STD-704, these devices have nominal 28VDC inputs with +5V and $\pm 15V$ triple outputs to satisfy a wide range of requirements. The basic circuit utilizes a pulse width modulated, feed forward topology at a nominal switching frequency of 550KHz. Input to output isolation is achieved through the use of transformers in the forward and feedback circuits.

The proprietary magnetic feedback circuit provides for an extremely wide bandwidth control loop with a high phase margin. The closed loop frequency response of this converter family extends to approximately 50KHz, resulting in superior line and load transient characteristics. This feedback method is also inherently temperature and radiation insensitive. This gives the AHF Series an important advantage over converters that incorporate opto-couplers in their design.

Manufactured in a facility qualified to MIL-PRF-38534, these converters are fabricated utilizing DSCC qualified processes. For available screening options, refer to device screening table in the data sheet. Variations in electrical, mechanical and screening can be accommodated. Contact IR Santa Clara for special requirements.

Features

- 16V to 40VDC Input Range (28VDC Nominal)
- 5V, $\pm 15V$ Output
- Infinite Short Circuit and Overload Protection
- 8W Output Power
- Fast Loop Response for Superior Transient Characteristics
- Operating Temperature Range from -55°C to +125°C Available
- Popular Industry Standard Pin-Out
- Resistance Seam Welded Case for Superior Long Term Hermeticity
- Efficiency Up to 75%
- Shutdown from External Signal
- 400,000 Hour MTBF at 85%
- Constant Switching Frequency (550KHz Nominal)
- Standard Microcircuit Drawing Available

AHF2815T Series

Specifications

$T_{CASE} = -55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{IN} = +28\text{V} \pm 5\%$ unless otherwise specified ⁷

Typical Characteristics		
Conversion frequency	550KHz	
Temperature Range ¹	Recommended Operating temperature	-55°C to +125°C
	Storage case temperature	-65°C to +135°C

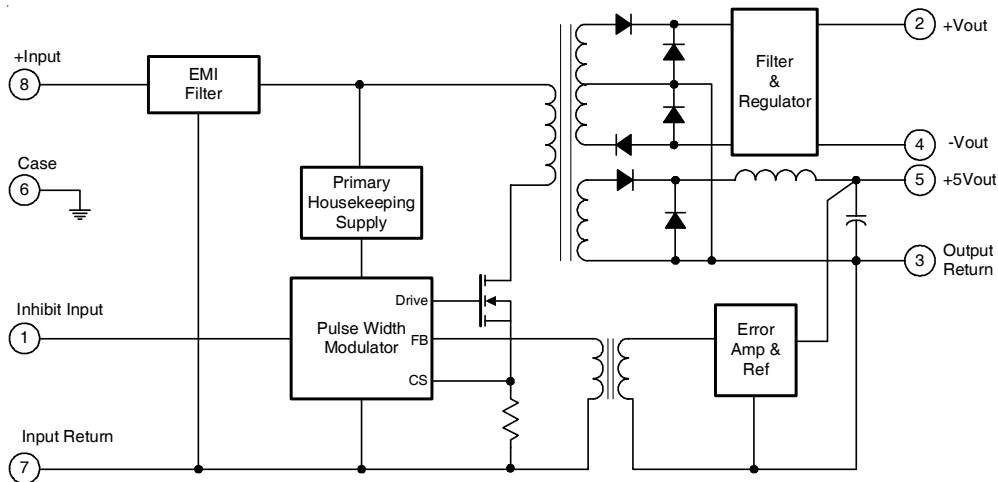

Test	Symbol	Conditions -55°C ≤ T _c ≤ +125°C V _{in} = 28 Vdc ±5%, C _L = 0, unless otherwise specified ⁷	AHF2815T Limits		Unit

Weight					35	g

For Notes to Specifications, refer to page 3

Notes to Specifications

1. Tested at each output.
2. Parameter guaranteed by line and load regulation tests.
3. At least 20percent of the total output power should be taken from the (+5.0 volt) main output.
4. Bandwidth guaranteed by design. Tested for 20KHz to 2.0MHz.
5. An overload is that condition with a load in excess of the rated load but less than that necessary to trigger the short circuit protection and is the condition of maximum power dissipation.
6. Above 125°C case temperature, derate output power linearly to 0 at 135°C case.
7. $T_{CASE} = -55^{\circ}C$ to $85^{\circ}C$ for non screened grade.

Block Diagram

Application Information

Inhibit Function

Connecting the inhibit input (Pin 1) to input common (Pin 7) will cause the converter to shut down. It is recommended that the inhibit pin be driven by an open collector device capable of sinking at least 400µA of current. The open circuit voltage of the inhibit input is 11.5 ± 1.0VDC.

Thermal Management

Assuming that there is no forced air flow, the package temperature rise above ambient (ΔT) may be calculated using the following expression:

$$\Delta T = 80 A^{-0.7} P^{0.85} \text{ (}^{\circ}C\text{)}$$

where A = the effective surface area in square inches (including heat sink if used), P = power dissipation in watts.

The total surface area of the AHF package is 4.9 square inches. If a worst case full load efficiency of 75% is assumed, then the case temperature rise can be calculated as follows:

$$P = P_{OUT} \left[\frac{1}{Eff} - 1 \right] = 8 \left[\frac{1}{.78} - 1 \right] = 2.66W$$

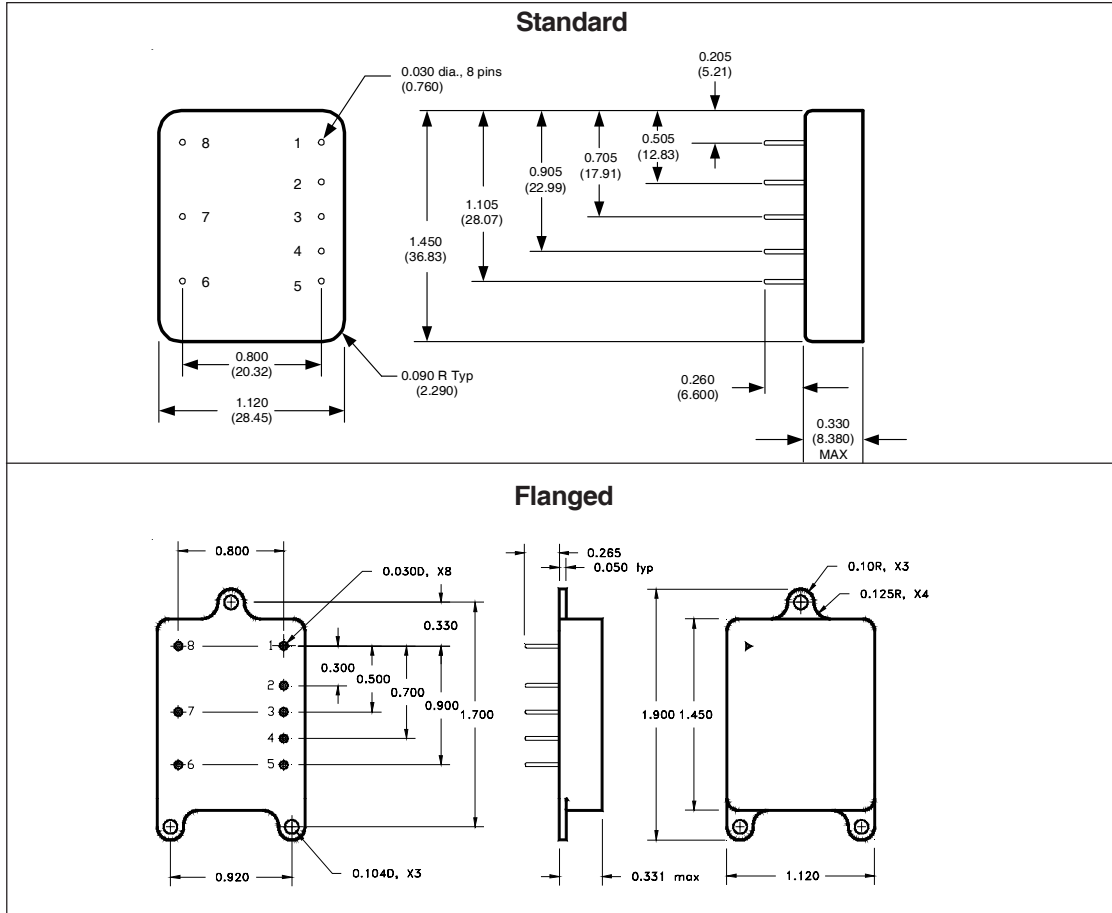

$$\Delta T = 80 (4.9)^{-0.7} (2.66)^{0.85} = 60.4^{\circ}C$$

Hence, if $T_{AMBIENT} = +25^{\circ}C$, the DC/DC converter case temperature will be approximately 85°C if no heat sink or air flow is provided.
