

HIGH RELIABILITY DC-DC CONVERTER

Description

The ATS Series DC-DC converters are a family of 25W, single and dual output, high reliability devices designed for rugged environments and extended temperature operations such as those encountered in military, aerospace and industrial applications. The converters are in full compliant with CE03 and CS01 of MIL-STD-461C. Features include small size, low weight and conservative component stress de-rating. For operations in radiation environments, the M3L series with the identical form factor and electrical rating is recommended.

All models include an external inhibit port and have an adjustable output voltage. They are enclosed in a hermetic 1.5" x 2.3" x .425" steel package and weight less than 85grams. The package utilizes rugged ceramic feed-thru copper core pins and is sealed using parallel seam welding.

Manufactured in a facility fully qualified to MIL-PRF-38534, these converters are fabricated utilizing DLA Land and Maritime qualified processes. For available screening options, refer to device screening table in the data sheet.

ATS SERIES

28V Input, Single/Dual Output

Features

- 16V to 50V DC Input Range
- Input Transient per MIL-STD-704D
- Up to 25W Output Power
- Single and Dual Output Models Include 3.3V, 5V, 12V, 15V, $\pm 5V$, $\pm 12V$ and $\pm 15V$
- Internal EMI Filter; Converter Capable of Meeting MIL-STD-461C CE03 and CS01
- Magnetically Coupled Feedback
- High Efficiency - to 82%
- -55°C to $+125^{\circ}\text{C}$ Operating Temperature Range
- $100\text{M}\Omega$ @ 500VDC Isolation
- Under-Voltage Lockout
- Short Circuit and Overload Protection
- Output Over Voltage Limiter
- Adjustable Output Voltage
- External Inhibit
- 1,000,000 Hour MTBF
- Low Weight, < 85 grams

Applications

- Military Aircraft
- Commercial Aircraft
- Missiles
- Ground Equipment

ATS SERIES (28V Input, Single/Dual Output)

Circuit Description

The ATS Series converters utilize a single-ended forward topology with resonant reset. The nominal switching frequency is 500KHz. Electrical isolation and tight output regulation are achieved through the use of a magnetically coupled feedback. Voltage feed-forward with duty factor limiting provides high line rejection and protection against output over voltage in the event of an internal control loop failure. This mechanism limits the maximum output voltage to approximately 20% over the nominal regardless of the line voltage.

An internal EMI filter allows the converter to meet the conducted emissions requirements of MIL-STD-461C on the input power leads. A single-stage output filter reduces the typical output ripple to less than 50mV peak-to-peak. Output current is limited under any load fault condition to approximately 125% of rated.

An overload condition causes the converter output to behave like a constant current source with the output voltage dropping below nominal. The converter will resume normal operation when the load current is reduced below the current limit point. This protects the converter from both overload and short circuit conditions. The current limit point exhibits a slightly negative temperature coefficient to reduce the possibility of thermal runaway.

An external inhibit port is provided to control converter operation. The converter's operation is inhibited when this pin is pulled low. It is designed to be driven by an open collector logic device. The pin may be left open for normal operation and has a nominal open circuit voltage of 10.5V with respect to the input return (pin 2). The output voltage of all models can be adjusted using a single external resistor.

Absolute Maximum Ratings		Recommended Operating Conditions	
Input voltage range	-0.5Vdc to +75Vdc	Input voltage range	+16Vdc to +50Vdc
Output power	Internally limited	Input voltage range ¹	+16Vdc to +38Vdc
Lead temperature	+300°C for 10 seconds	Output power	0 to Max. Rated
Operating case temperature	-55°C to +125°C	Operating temperature ²	-55°C to +125°C
Storage temperature	-55°C to +135°C	Operating temperature ¹	-55°C to +70°C

¹ Meets derating per MIL-STD-975

² For operation at +125°C see table note 13

Notes for Electrical Performance Characteristics Table

- Parameter is tested as part of design characterization or after design changes. Thereafter, parameter shall be guaranteed to the limits specified.
- Parameter verified during line and load regulation tests.
- Output load current must be distributed such that at least 20% of the total load current is being provided by one of the outputs.
- Load current split equally between outputs on dual output models.
- Cross regulation is measured with 20% rated load on output under test while changing the load on the other output from 20% to 80% of rated.
- Guaranteed for a D.C. to 20MHz bandwidth. Tested using a 20KHz to 10MHz bandwidth using the circuit on page 6.
- Capacitive load may be any value from 0 to the maximum limit without compromising dc performance. A capacitive load in excess of the maximum limit may interfere with the proper operation of the converter's overload protection, causing erratic behavior during turn-on.
- Overload power dissipation is defined as the device power dissipation with the load set such that V_{OUT} = 90% of nominal.
- Load step transition time ≥ 10μs.
- Recovery time is measured from the initiation of the transient to where V_{OUT} has returned to within ±1.0% of its steady state value.
- Line step transition time ≥ 100μs.
- Turn-on delay time from either a step application of input power or a logic low to a logic high transition on the inhibit pin (pin 4) to the point where V_{OUT} = 90% of nominal.
- For operation at temperatures between +85°C and +125°C, derate the maximum input voltage linearly from 100% to 75%.
